FANUC INDUSTRIAL ROBOT SPOT WELDING PROJECT

R-30iB Controller with Servo Gun – ROBOGUIDE Demonstration

1. Project Overview

This project is a two-point resistance spot-welding demonstration for a FANUC R-30iB robot equipped with a servo welding gun. The robot approaches defined weld locations on a clamped sheet-metal workpiece. At each taught point, the configured servo-gun SPOT instruction performs the programmed gun motion and weld sequence. The intended environment is a virtual FANUC ROBOGUIDE workcell.

2. Objectives

Create a simulated spot-welding cell; understand robot approach and weld-point teaching; use the FANUC servo-gun SPOT instruction; configure tool and user frames; review gun setup and welding schedules; and validate reach, clearance, sequence and simulated I/O before considering any physical application.

3. Workcell Design

The proposed cell contains one FANUC R-30iB robot, one servo spot-welding gun, two sheet-metal components, a locating fixture, a base/table and suitable safety guarding. Two weld locations are used to demonstrate a short sequence. The gun must be configured as a servo-gun axis in the controller. The robot tool frame, payload, gun TCP, close direction and user frame must match the selected virtual cell.

4. Servo-Gun Programming Concept

The FANUC servo-gun manual describes a SPOT instruction format using start distance (SD), pressure schedule (P), part thickness (t), weld schedule (S) and end distance (ED). A representative instruction is SPOT[SD=1,P=1,t=2.0,S=1,ED=1]. The values in this example are placeholders only. They identify schedule slots and an illustrative thickness; they are not welding recommendations. Configure schedules from a qualified, validated welding procedure.

5. Program Sequence

The supplied LS template moves to a safe start position, approaches weld point 1, executes a servo-gun SPOT instruction, retracts, moves to weld point 2, executes the second SPOT instruction, retracts and returns to the safe position. P[1] and P[3] are approach points; P[2] and P[4] are weld points; P[5] is a safe start/retract point. All positions in the LS file are example coordinates and must be retaught.

6. ROBOGUIDE Implementation Steps

1. Create a workcell with a controller revision compatible with the installed R-30iB Servo Gun and spot-welding options.
2. Add the robot, servo gun, sheet-metal workpiece and fixture. Check the gun model and axis group.
3. Verify servo-gun configuration, mastering, gun close direction, tool frame, payload and TCP.

4. Configure pressure, start-distance, end-distance and weld schedules using approved process data.
5. Teach the safe start, approach and weld positions in the actual virtual workcell.
6. Load or recreate the supplied LS program. Verify the SPOT instruction parameters and schedule references.
7. Use permitted simulation, tryout or weld-I/O simulation modes. Check gun closure, sequence completion and opening.
8. Check reach, collisions, electrode alignment, fixture clearance and alarms. Save the workcell and capture evidence.

7. Testing and Expected Outcome

The simulation should show the robot moving safely between two weld locations and initiating the configured servo-gun sequence at each location. Review the robot path, gun movement, schedule references, weld-complete feedback and alarms. Record only the results actually observed in ROBOGUIDE. Add screenshots of the cell, program, gun setup and completed simulation to the final submission.

8. Safety and Engineering Limitations

This is an educational starter example, not a production-ready or safety-certified program. Exact instruction syntax and screens depend on controller software revision and installed options. Weld current, weld time, squeeze/hold time, electrode force, pressure, tip geometry and material parameters must be established by a qualified welding/process engineer using a validated welding procedure. Do not run this template on physical equipment without approved commissioning, guarding, interlocks, risk assessment, emergency-stop checks, calibration and authorized supervision.

9. Conclusion

This project introduces the main elements of FANUC servo-gun spot-welding automation: workcell design, servo-gun configuration, taught robot positions, schedule-based SPOT instructions and simulation-based validation. Completing the workcell and recording the actual simulation will provide practical evidence of robotics and automation skills.

10. Submission Evidence Checklist

☐ROBOGUIDE workcell screenshot showing robot, gun and fixture.

☐Servo Gun setup screen and configured schedule references.

☐Program listing showing SPOT instructions.

☐Screenshots or video of both simulated weld cycles.

☐Saved ROBOGUIDE workcell and final corrected LS program.
